

Triometric and Amosca partner to monitor Hyperion performance experience

27th March 2008

By Sheetal Vyas

Triometric, a provider of web performance and real-time monitoring services, has partnered with Hyperion application management provider Amosca, to launch two new services, Application Upgrade Review and Performance Health Check.

According to the two companies, the benefits of the joint collaboration will be enjoyed by organisations that are planning to upgrade to Hyperion's System 9 business intelligence platform. Triometric monitors the end-user experience at the Hyperion application level and Amosca manage the application configuration and usability in terms of its design, review or upgrade migration.

With the integration of the skills, Triometric and Amosca will develop the ability to measure actual end-user performance and identify problems that arise. Modifications to the application or the infrastructure configuration will be made by Amosca.

Triometric says that the Application Upgrade Review, which will be developed in a six-month project, will enable companies using Hyperion System 9, as well as other management platforms, to benchmark their existing application. It helps the client to first stress test the new environment using the profile of real users and then verify the actual performance of the new environment.

The Performance Health Check feature looks into specific requirements such as benchmarking the user base response times or looking at application anomalies. Triometric says that it will work with Amosca to enable its Hyperion customers to get a deeper analysis of the users' performance experience and help them understand ways in which the web applications can be improvised, irrespective of whether they are web or Citrix based.

Noel Gorvett, managing director of Amosca, said: "Over the coming months we expect many companies to be upgrading their Hyperion applications to Hyperion's System 9 platform. An application upgrade review will enable these businesses to monitor the progress of the upgrade with respect to end user performance and to quantify and validate the benefits of the upgrade. Amosca can also offer the EPM Maestro suite to enhance the user and administration experience."
